

Table Handling Test Document

We evaluated three instructional conditions across two studies. The following table summarizes participant demographics and the primary outcome measures for each condition.

Table 1. Participant demographics by condition.

Condition	Participants	Mean age	Conceptual gain	Reported pressure
Robot failure	46 students	13.6 years	High improvement	Low
Peer failure	45 students	13.8 years	Moderate improvement	High
Direct instruction	44 students	13.7 years	Small improvement	Moderate
Total sample	135 students	13.7 years	—	—

As shown above, the robot failure condition produced the largest gain in conceptual understanding while reporting lower social pressure than the peer failure condition.
